

Common Network & Wi-Fi Issues and Resolutions

Issue

Symptoms

Causes

Fix

No Internet Connection

- . "No internet" or "Limited connectivity"
- . Websites do not load
- . Connected to Wi-Fi but no access

- . Router or modem offline
- . DHCP failure (APIPA address)
- . Incorrect network configuration
- . DNS resolution issues

- . Restart network equipment
- . Renew IP address
- . Check network adapter status
- . Change DNS to a known working resolver
- . Escalate if outage persists

Connected to Wi-Fi but No Network Access

- . Wi-Fi shows connected
- . Applications cannot reach the internet
- . VPN fails to connect

- . Incorrect IP configuration
- . Captive portal not completed
- . DNS issues
- . Firewall or security software blocking traffic

- . Disconnect and reconnect to Wi-Fi
- . Forget and rejoin the network
- . Check IP address and gateway
- . Test DNS resolution
- . Temporarily disable VPN/firewall to test

Slow Network / Intermittent Connectivity

- . Pages load slowly
- . Downloads stall
- . Connection drops in and out

- . Weak Wi-Fi signal
- . Network congestion
- . Interference from nearby devices
- . Faulty network adapter or cable

- . Move closer to the access point
- . Switch between 2.4 GHz and 5 GHz
- . Restart network adapter
- . Test with Ethernet
- . Escalate if issue affects multiple users

DNS Issues

- . Can reach IP addresses but not websites
- . "DNS server not responding"
- . Internal resources not resolving

- . DNS server unreachable
- . Incorrect DNS configuration
- . Local DNS cache issues

- . Flush DNS cache
- . Change DNS server temporarily
- . Restart network services
- . Verify correct DNS settings
- . Escalate if internal DNS failure suspected
